

## Angular JS ([\(173\) Learn Angularjs step by step \( Training video\) - YouTube](#))

Angular JS bind (connect) HTML Page to JavaScript Object to send data from HTML to JavaScript Object and Receive Data from JavaScript Object to HTML. ([175\) Angular Tutorial for Beginners: Learn Angular & TypeScript - YouTube](#))

### Basic Syntax:

### Basic Working Steps

1. Design your html page that required
2. Add angular js in HTML
  - a. Add **angular js script** file in html header
  - b. Write javascript class (**Customer**)
  - c. Add angular **module** in both **html** and **javascript**
  - d. Add **controller name** in **module**
  - e. Add **ng-class** in div
  - f. For data input from javascript to html, use **ng-model** in html **input** field
  - g. For show data use **{{ }}** in HTML Page
3. Add angular js script file in html page

```
<!DOCTYPE html>
<html>
<head>
  <meta charset="utf-8" />
  <title></title>
  <script src="https://ajax.googleapis.com/ajax/libs/angularjs/1.8.2/angular.min.js"></script>
</head>
<script>
function Customer($scope)
{
  $scope.CustomerName = "Shiv";
  $scope.CustomerCode = "1001";
}
var myapp = angular.module("myapp", []);
myapp.controller("Customer", Customer);
</script>
<body ng-app="myapp">
  <div ng-controller="Customer">
    Customer Name:- <input type="text" ng-model="CustomerName" name="CustomerName" id="CustomerName"><br>
    Customer Code:- <input type="text" ng-model="CustomerCode" name="CustomerCode" id="CustomerCode"><br>
    <div id="DivCustomerName">{{ CustomerName }}</div>
    <div id="DivCustomerCode">{{ CustomerCode }}</div>
  </div>
</body>
</html>
```

Angular JS Script

Class

Connection with Class (Customer) and HTML (ng-app) Page

Data input

Data Output/Show

## Summation/Mathematical Operation

1. In expression, we can sum

```
{{1+2}}
```

Result: 5

2. Concatenation :

```
{{CustomerName + CustomerCode}}
```

## ng-submit: it work like Onclick property of HTML

In Angular Class:

```
$scope.Submit = function () {  
    if($scope.CustomerName.length==0)  
    {  
        alert("Not a proper data");  
    }  
    else  
    {  
        alert("Proper data");  
    }  
}
```

In HTML Page:

```
<input type="submit" ng-click="Submit()" value="Submit" />
```

Example of code:

```
<!DOCTYPE html>  
<html>  
<head>  
    <meta charset="utf-8" />  
    <title></title>  
    <script src="https://ajax.googleapis.com/ajax/libs/angularjs/1.8.2/angular.min.js"></script>  
</head>  
<script>  
function Customer($scope)  
{  
    $scope.CustomerName = "Shiv";  
    $scope.CustomerCode = "1001";  
    $scope.Submit = function () {  
        if ($scope.CustomerName.length == 0) {  
            alert("Enter customer name");  
        }  
        if ($scope.CustomerCode.length == 0) {  
            alert("Enter customer code");  
        }  
    }  
}  
var myapp = angular.module("myapp", []);  
myapp.controller("Customer", Customer);  
</script>  
<body ng-app="myapp">  
    <div ng-controller="Customer">  
        Customer Name:- <input type="text" ng-model="CustomerName" name="CustomerName" id="CustomerName"><br>  
        Customer Code:- <input type="text" ng-model="CustomerCode" name="CustomerCode" id="CustomerCode"><br>  
        <input type="submit" ng-click="Submit()" value="Submit" />  
  
        <div id="DivCustomerName">{{ CustomerName }}</div>  
        <div id="DivCustomerCode">{{ CustomerCode }}</div>  
    </div>  
</body>  
</html>
```

## Insert Data by angular js

```
<div class="container" style="width:500px;">  
    <h3 align="center">AngularJS Tutorial </h3>  
    <div ng-app="myapp" ng-controller="usercontroller">  
        <label>Country Code </label>  
        <input type="text" name="" ng-model="id_send" class="form-control" />  
        <br />  
        <label>Country</label>  
        <input type="text" name="" ng-model="name_send" class="form-control" />  
        <br />  
        <input type="submit" name="btnInsert" class="btn btn-info" ng-click="insertData()" value="ADD" />  
    </div>  
</div>
```

```

<script>

var app = angular.module('myapp', []);
app.controller('usercontroller', function($scope, $http) {
  $scope.insertData = function() {

    $http.post("insert.php",
      {'id': $scope.id_send, 'names': $scope.name_send}
    ).success(function(data) {
      alert(data);
      $scope.name_send = null;
      $scope.id_send = null;
    })
  } <!-- click -->
}

```

```

<?php
//insert.php
$connect = mysqli_connect("127.0.0.1:3306", "root", "root", "test");

$data = json_decode(file_get_contents("php://input"));

if(count($data) > 0)
{
    $id_received = mysqli_real_escape_string($connect, $data->id);
    $name_received = mysqli_real_escape_string($connect, $data->names);

    $query = "INSERT INTO country(id, name) VALUES ('$id_received', '$name_received')";
    if(mysqli_query($connect, $query))
    {
        echo "Data Inserted...";
    }
    else
    {
        echo 'Error';
    }
}
?>

```

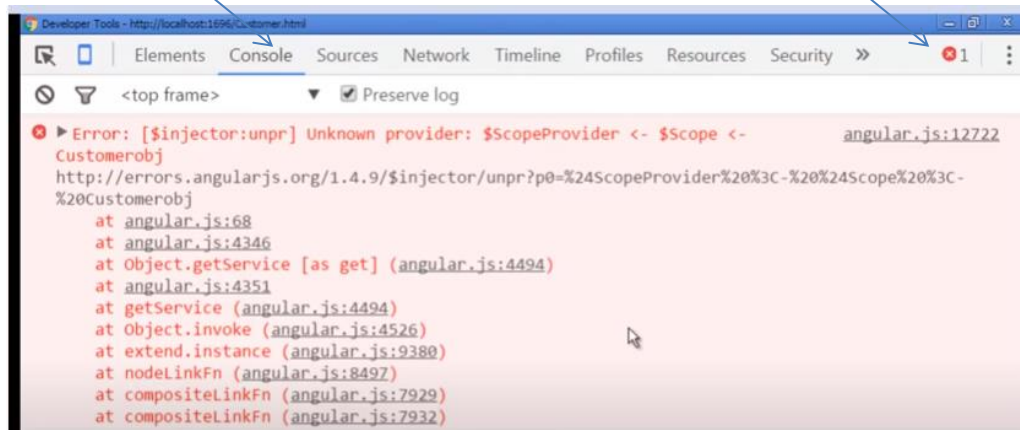

## ● Debubing :

Press **F12** in chrome browser for debugger → see the error at right corner

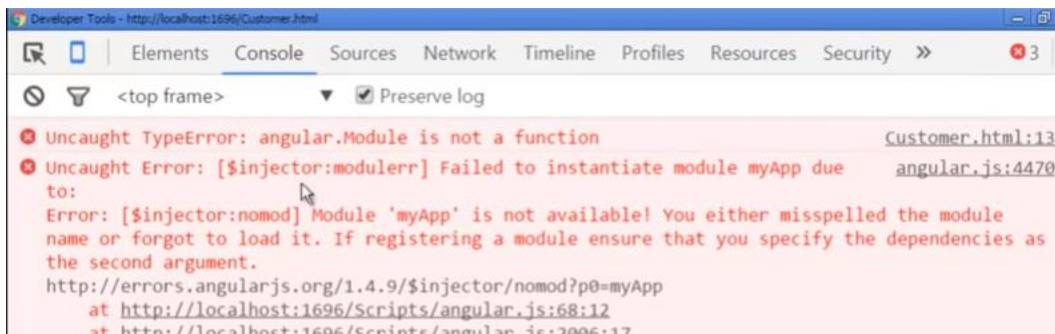

**Injector error**

Second, Click on Console

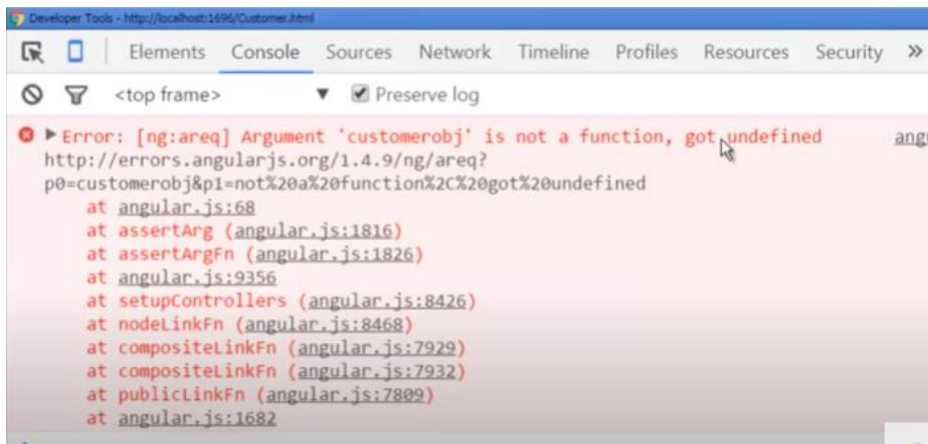

first see error

## Injector modul error

**Undefined error** : Controller of angular JS is not properly defined. It may be spelling mistake

## At the end of the course
